10 Bad Designs in the Siebel Hall
Jessie Chin (Human Factors)

1. The door handle doesn’t imply which side to push

2. There is no indicator for which floor the elevator was in, and this might cause inconvenience to the users. (There is no sign for going up or coming down for the elevator either.)
3. The “on” and “off” button for emergency call located apart from each other.
4. The confusion of buttons with undefined similar functions.
   —Alarm, Stop, and the Emergency Call.

5. The door is unclear to push or pull
6. The direction sign of stairs seems to be useless which should imply the direction of nearest stairs.

7. The sign which located at the end of the hall way seems to be too obvious to be there. (It’s sure that the room cannot be in the mid-air out of the building.)
8. There are two doors for the same room which opened from different sides. Thus, the unfamiliar users might confuse the two doors were for two different rooms.

9. It’s difficult for a visitor to find a person whose name didn’t go with either the alphabetic order or the room number.
10. The bathroom is not fully designed for the disabled. First, the sink is still too high for people on the wheelchair. Then, the hand-dryer is impossible to reach for people on the wheelchair since there is a trash can on the way. And the door is also too heavy for the user on the wheelchair.
