My Ideas:

- The boxes in the mock up represent individual emails or threads. The subject and a snippet of text from the email will be displayed on each box. The amount of text that is displayed in the email will depend on the size of the box.
- Clicking on the email will make it expand to take up the whole window, allowing the user to perform all the same tasks as a regular email client.
- New mail will be displayed at the top of the page in a bigger box, and as mail is received it will shift toward the bottom of the page and get smaller.
- All of the user’s mail will be displayed on the same page, but it will get scrunched down to the bottom.
- The user will be able to create labels for all incoming mail, which represent different colors on the mock up. The name of the label will be shown on the box, which the user can choose to turn on or off.
- Data will be collected as email is sent and received. Email from people the user corresponds with the most will show up in a larger box than email from people the user does not contact often.
- A search can be performed on all email (or by label) which will systematically reorder email depending on the search criteria. Email will start to be reordered in real time as the user starts typing in the search box. Search results more relevant to the entered text will be bigger at the top, and search results less relevant will move to the bottom.
