9/17/2008
**Explanation:**

The map visualizes location where I received my email from. The bigger and darker colors represent higher frequency emails. For instance, the path from my home country is darker (Red) than the path from another country.

From this visualization, I can make a generalization that lots of my emails are come from my home country and location that is nearest to me. We can see this generalization by looking at the density of the point and bigger circle around it.

In this map, my assumption is each “active people/friend” sends at least one email. I don’t represent the actual email in this case.

**Legends for the map:**
- Location (City) for active people / friends is represented by the circle.
- Paths represent email communication
- Plus symbol represent my current location
