My visualization would be best described as a very futuristic device. In fact, since this is aimed at the 22nd century, it will not even be a phone as we think of them today. My phone will be a device that is shaped like a small rod. The rod can be opened and turned into a flexible screen such as the keyboards they are currently developing. This screen is touch sensitive and will allow you to search your contacts, your email, the internet, or search which music or movie you want to listen to/watch next. Since Microsoft is working on their touch interfaces, you will be able to put the phone on a table and look at your data (contacts, music) on the Microsoft Surface like interfaces all over the world. If you are in a store listening to music, you could put your phone on the table in the store and it would tell you which song is playing. When you get a call, you can choose to answer it through modern technology. It will have switches that you can control through pressing certain spots on your clothes (I’m thinking down the sleeves) or by voice controls which will be much better in the future. To indicate that you are talking to someone, your clothes will glow a certain color or perhaps throb with a light. You of course can also hold the phone to your ear if you wish, but most people will have tiny earphones in their ears and will simply listen to the other person that way.

A flexible screen such as will be popular in the future.
surface-like possibilities.
