We want to make a web application that allows user to check the availability of restaurant seating. Ideally, the application should tell if a restaurant is full, empty, have long queues etc. User can choose the restaurant in a google-map like interface. The web application can be accessed from mobile devices for ease of use. The application should also have information about the restaurants (i.e. popular items). Another feature is to allow user to check availability of nearby parking area.

Restaurant nowadays have digital seating chart and the different food that people order. Thus this information can be shared via internet to the web application.
