CS 465: Project Proposal

My motivation for this project stems from my experience during my summer internship at Lehman Brothers. One particular problem that my business unit faced, was the clients were not happy with the application we developed. They found it difficult to use, or it may not have had the features they needed. There needs to be a simple way to show look of an application with some minimal functionality.

The audience for this project is not limited to clients in the financial industry. This application is for the developers and their clients. Whoever they might be.

This project is an application that acts like an interactive Visio or Omni Graffle. It allows users to create a workflow and have a user interface, also. There will be set functions and objects that a user can drag and drop. These objects will include menus, dialogs, buttons, etc. Then they can click and go to the next “page.” This will allow the clients and developers to create visually appealing and usable applications.
