Description
I created a visualization of my email based on 2 statistics, average email length, and average word length of an email. There are small multiples for each person you correspond with, arranged in descending frequency. This way the people that you talk to the most will be listed first. For each person, display two rectangles. The first rectangle, displayed in red will be the emails that person sends you. The width is determined by the average word length in the email, and the height will be the average length of the post. The blue rectangle has the same dimensions for all the emails you send to that person. I hypothesize that you will have similar rectangles for the people you talk to. My guess is that people you work with will have average length emails, with longer words. People that you talk to casually or for entertainment will be either very short or very long, but with shorter average word length. If you are trying to impress someone like a teacher or a supervisor, you may have longer word length than them. If your emails are much longer, again they might be to a teacher or supervisor, with you explaining details and them responding with a quick verification. Each of the small multiples will be relative to your other emails. This could cause confusion when you have only talked to a person once or twice, and the variables could be very skewed. This is why I organized it by frequency, so you could easily compare people you talked to a similar amount.
