Description

In previous visualizations, I have brought up the visualization of words in digital communication. When I have tried to implement a visualization like this, I have been unable to work it in with other information I want to visualize. So, for this visualization, I really wanted to focus on the use of words in communication. Each sphere in this visualization represents a friend that you have chatted with in the past. The size of each of the spheres represent the number of words a particular friend has used in their conversation with you. As for the color of the sphere, it’s the hue represents how recently you have talked to that person. I had a few other ideas for what the color could represent, but at the moment I feel like time gives the most information. Lastly, I would like to provide the user with a way of seeing a visualization of the words by their friend. At the moment, I plan on allowing the user to click on an orb, and a series of bars representing each word will appear along the bottom. This may change if I find a better way to visualize this information.
