Audio Visualization

Idea: The main idea behind the visualization was a concentration on the pauses in conversation. I was curious to see how those pauses related to the overall conversation. That led to the idea of displaying how people interrupt each other during conversation, and hopefully how interrupting someone effects how often people pause in a conversation.

Description: The white space in the graph below denotes periods of silence. The colored areas represent speech, and the brightness of the color denotes volume. Any periods of overlap, or silence will be easily seen in the visualization.
