Holder

In this visualization we try to employ the physics mechanics of how things goes down based on the gravity. Based on the size of the box, the box will goes down or goes up. In this design, we were trying to implement Newton’s law and physics behind it. There will be a static holder in the background and a string attached from the holder to the box.

We are not sure what social data to use for this visualization but one of the possibility is to employ the how many emails were sent/receive from the user and as the user deletes or adds more emails, the box size will increase and eventually the box will move downwards. As the user deletes the email or the content of the data, the box will go upward because the mass of the box has been decreased.
